

Saad Mahamood

Nationality: British

LinkedIn: <http://uk.linkedin.com/pub/saad-mahamood/5/374/7>

PROFILE

A computational linguist with academic experience in building and researching AI-based Natural Language Generation systems that convert large datasets into textual summaries. I have extensive experience of working alongside domain experts. I'm also capable of working as part of a team or individually, and able to be inventive to research and solve real-world problems. I am looking to broaden my experiences by tackling new challenges. Additionally, I hope that my research & development skills will prove to be useful assets for a future employer as well.

EDUCATION

2006-2010 **University of Aberdeen – PhD in Computing Science**

2005-2006 **University of Sussex – MSc Informatics**

2001-2005 **University of Wales, Aberystwyth – BSc Computing Science**

PHD DISSERTATION

Thesis Title: "Generating affective Natural Language for Parents of Neonatal Infants."

My PhD focused on the development of a Natural Language Generation (NLG) based system to convert clinical neonatal data into automatic daily summaries for parents of babies in Neonatal Intensive Care. This was done by summarizing the information in a baby's electronic patient record to produce reports focusing on matters of most interest to the parent. My thesis also focused on the informational and emotional needs of parents and tried to understand how these needs could be met by generating tailored automatic reports. During my PhD I constructed a prototype NLG system to generate such reports for parents and evaluated this system with parents that previously had a baby in neonatal care.

WORK EXPERIENCE

Senior Natural Language Generation Engineer, Arria NLG plc., Aberdeen **August 2012 - Present**

Currently employed by Arria NLG (formerly Data2Text limited) to work on the creation of new generic tools that can enable the quicker/easier production of NLG systems for commercial clients. In the past most NLG systems contained many bespoke software components specific to a particular big data client, thus making reuse inherently difficult. I have worked projects such as on multi-modal generation that combines NLG text generation with graphical representations in the form of graphs. More recently I have been involved in helping to build a new NLG multilingual realiser that allows for the generation of texts in more than one language from a given syntactical sentence representation.

I have direct experience working and engaging with commercial clients to deliver NLG based solutions. I have also taken the lead in an academic research paper within a commercial environment and helping to review a patent application based directly on the intellectual property that I've worked on.

Also, I have been given the responsibility of helping to maintain the open source Java *SimpleNLG* realiser project (<https://github.com/simplenlg/simplenlg>). This has mainly involved helping to write patches for bugs, packaging new releases and general project maintenance.

Honorary Research Fellow, Computing Science, University of Aberdeen **July 2012 - Present**

I have been given a Honorary appointment by the University of Aberdeen to continue the work I have done during my previous Research Fellow tenure on a part-time basis. In particular, this involves working on research papers in my spare time, reviewing research papers for conferences, and attending the NLG research group at the University of Aberdeen.

Research Fellow, Computing Science, University of Aberdeen**July 2010 - June 2012**

Appointed as a research fellow to work on a follow-up project on research work done during my PhD. During this project I was responsible for the development, deployment, refinement, and evaluation of an NLG system to convert neonatal clinical data into reports for parents of pre-term neonates. I worked on refining the prototype system that I developed as part of my PhD. This meant I was working closely with clinical domain experts and neonatal clinical data to help refine the quality of texts generated and bring about the integration of our NLG system with the existing electronic health record software. I also developed the web-based interface for parents to access the automatically generated reports from a public computer. Additionally, I was also responsible for project managing a research assistant and given the responsibility to apply for NHS ethics approval so that the system could be evaluated on ward with parents.

SKILLS

Computer Programming Languages: Java (Tomcat, Servlets, JSP, Swing, SWT/JFace), Python, PHP, HTML, Javascript (inc. jQuery, jQuery UI, JSON, AJAX), SQL (inc. experience with MS SQL, MySQL, & SQLite), XML, XML Schema, and some experience of Ruby scripting.

Ontologies: Some experience of using Protégé for the management of an OWL based ontology.

Source/Project Control: SVN, Git, and experience of using Maven.

Operating Systems: Mac OS X and Windows, Windows Server, and Linux.

Languages: French (basic) and Urdu (intermediate).

Other: Experience of developing under the Agile development methodology.
